### AL WOLGAST HAS CHANCE WITH NELSON

Milwaukee Fighter Has Been Battering Against Heavier Men.

Chicago, June 29.—When it comes to giving away weight, no fighter in the business can be counted quite as liberal as one Al Wolgast, pride of Milwaukee, but who is a resident of Cadillac, Mich. The little fellow, who can be a featherweight when he has a, would rather be a lightweight and with the lightweight mingle.

The grind of weight-making is not to the liking of this bright young chap and hence he is out with the announcement that hereafter he will scale at a low figure for none but Abe Attell, the champion of the featherweight class. He is willing to box anybody, but unless his opponent is a champion, the weight will be of a catch variety or there will be no scrap.

Wolgast is going to battle Nelson, another champion, in Los Angeles, another ten-round bout, but Saturday he weighed only 127 1/2 pounds. It appears that the Tommy O'Toole people saw him weigh for Tommy Langford a short time ago, and that time noted that Ad just brought the beam up 126 pounds. So they felt safe in insisting upon 124 pounds for Tommy's battle. Ad never budged the beam at that mark after removing only his hat, coat and shoes. Yet this is the boy who is given credit for besting George Memsie in Los Angeles a short time back, and Memsie really is one of the strongest who scales 135 pounds in good condition.

Wolgast has been giving away weight during his entire career and is one of the few fighters not afraid to do it. But Wolgast is not for making a low figure any more and says that if Attell wants a fight with him he will have to agree to 122 pounds five hours before starting the scrap. For Attell, and Attell alone, among the featherweights will he weigh in. The others will have to take it as

they find it or else let it alone altogether.

"What's to be afraid of in this fellow Nelson?" he asked me yesterday upon his return from Philadelphia. "He never knocked anybody out in a short fight—that is, anybody of any account—and for that matter he never knocked anybody out in a long fight. They all fall of exhaustion. So why should I fear him? Memsie is just as tough in ten rounds as Nelson and he couldn't have knocked my hat off had I worn it into the ring."

"No, I expect to more than hold my own with Nelson and perhaps best him. Just you watch me, now. Wolgast, in his scheme of accepting any and all matches that gave any sort of promise of financial returns, has done well in the game and a short time back purchased an eighty-acre tract of land two and one-half miles from Cadillac, Mich., where his parents are installed and where Ad will hike after his fighting days are over."

#### WON EMPEROR'S CUP.

Kiel, June 28.—The third Sonderklasse race was sailed today in very unfavorable weather. The emperor was present at the start and the princes were again at the rudders of their yachts. The crown prince sailed Angela IV. Prince Etel was in command of Elizabeth III. Adelbert of Jock and Prince Henry of Tille XII. Havella, which won the second Sonderklasse race, was again a victor and thus captured the emperor's cup and the Armour cup, although the fourth race is yet to be contested. The crown prince's Angela IV was second and Seehunn II was third.

#### AMERICAN MAKES FAREWELL CALLS IN CITY OF BERLIN

Berlin, June 28.—Lieutenant Colonel John P. Wisner, retiring American military attaché, made his farewell calls on the general staff at the war office today. He was accompanied by Captain Samuel G. Sharpley, who will succeed him.

The emperor, when he received Lieutenant-Colonel Wisner in farewell audience at Kiel, spoke in the most cordial terms of his work while at tache and in referring to his leaving added: "I could shed tears."

### CHICAGO DEFEATED BY DETROIT TEAM

In National League Pittsburgh by Timely Hitting Wins From Cincinnati.

#### AMERICAN LEAGUE.

Chicago, 1; Detroit, 2.  
Chicago, June 28.—Detroit defeated Chicago, 2 to 1, today in a hard-fought ten-inning game, which was marked by wrangling. Atz, Cobb and Schaefer were put out of the game for disputing the umpire's decisions. Score:  
Chicago ..... 1  
Detroit ..... 2  
Burns, Walsh and Sullivan; Summers, Speer, Willett and Stange.

Washington, 5; Boston, 6.  
Washington, June 28.—Boston made it four out of five in the series by defeating Washington today, 6 to 5. Score:  
Washington ..... 6  
Boston ..... 5  
Altrock, Groom, Johnson and Street; Wood, Steel, Arrellanes and Speer.

St. Louis, 5; Cleveland, 0.  
St. Louis, June 28.—Steady pitching by Pelt and hard hitting by Hoffman, Jones and Ferris defeated Cleveland today. Score:  
St. Louis ..... 5  
Cleveland ..... 0  
Pelt and Criger; Sifton, Falkenberg and Bemis.

Philadelphia, 1; New York, 4.  
New York, June 28.—New York defeated Philadelphia today, 4 to 1. Score:  
Philadelphia ..... 1  
New York ..... 4  
Morgan, Thomas; Doyle, Manning and Sweeney.

#### NATIONAL LEAGUE.

Cincinnati, 2; Pittsburgh, 3.  
Cincinnati, June 28.—Timely hitting won today's game for Pittsburgh. Score:  
Cincinnati ..... 2  
Pittsburgh ..... 3  
Ewing, Dubue and McLean; Camnitz and Gibson.

Philadelphia, 5; Boston, 3.  
Boston, June 28.—Philadelphia won the first game of a scheduled double-header today, 5 to 3, the second one being postponed on account of heavy shower which started after the finish of the first game. Score:  
Philadelphia ..... 5  
Boston ..... 3  
Corrigan, McQuillen and Dooin; Tuckey and Garham. Umpires: Rigler and Truby.

#### NORTHWESTERN LEAGUE.

Vancouver, 0; Tacoma, 1.  
Tacoma, June 28.—Score:

#### SEALED PROPOSALS.

Will be received by the Board of Trustees of the State Industrial School for funding, f. e. b. Five Points, Ogden, Utah, 1500 feet of four-inch galvanized pipe, together with all necessary couplings, and 1000 feet of one-inch galvanized pipe, together with all necessary couplings. Further information may be obtained at the office of the superintendent of the institution.

Bids must be sealed and marked "Bids for pipe," and addressed to the State Industrial School, Ogden, Utah. They must be received on or before the 30th day of June. They will be opened at 2 o'clock p. m. of that day. The Board reserves the right to reject any and all bids not advantageous to the State.

#### SEALED PROPOSALS.

Will be received by the Board of Trustees of the State Industrial School for plastering, inclusive of all material, etc., the Girls' New Cottage. Plans and specifications may be seen at the office of Smith & Hodgson, architects, 312 Eccles Building, Ogden.

Bids must be sealed and marked "Bids for plastering," and addressed to the State Industrial School. They must be received on or before Wednesday, June 30th, and they will be opened at 2 o'clock on that date. The Board reserves the right to reject any and all bids not advantageous to the State.

By order of the Board of Trustees, H. H. THOMAS, Superintendent, Ogden, Utah, June 17th, 1909.

#### NOTICE.

NOTICE IS HEREBY GIVEN that, pursuant to the direction of the Board of County Commissioners of Weber County, Utah, and Sections 527, 528, 529 and 530, Compiled Laws of 1907, bids will be received at my office until July 3, 1909, for such books, blanks and stationery as may be required by the several county officers of said county during the

year beginning July 1, 1909. The probable quantity of each item may be ascertained by referring to the estimates of the same prepared by the several officers and on file in my office, and to which reference is hereby made. All bids shall state separately the price of each item of books, blanks and stationery to be furnished, and the right is reserved on behalf of the Board of County Commissioners to accept or reject any and all bids, or to accept or reject a part of any bid. The party to whom the contract is awarded will be required to give a bond for the faithful performance of the contract.

Bids will also be received until July 3rd, 1909, for the publication of county reports, notices and advertisements during the year, beginning July 1, 1909, the right being reserved by the Board of County Commissioners to reject any and all bids and to re-advertise.

By order of the Board of County Commissioners,

S. G. DYE, County Clerk, Ogden, Utah, June 28, 1909.

Last publication July 3rd, 1909.

#### MECHANICAL FINGERS.

Barton S. Moynieux Invents a Machine Which Has Nearly Human Fingers.

Much space has been given of recent date in the American press to inventions, the larger portion of which have been improvements along given lines. It has often been said that the time was not far off when men would invent machines to practically bring back life. An article was written recently on an invention in which the inventor claimed that for a cost of \$10,000,000 a series of reflectors could be so set as to make night into day. We could go on telling of many wonderful things that are being created daily by the hands of men, but we will not do so, as the intention of this article is to convey to the reader that everlastingly sticking to a project will assure its success.

Some seven years ago Mr. Barton S. Moynieux of Buffalo, N. Y., was possessed of the idea that the greatest need in this country today commercially was a machine for proper handling of mail. He went to work on the subject and within the month a private exhibition of what he has accomplished was shown in his laboratory at Buffalo.

He has created a machine known as the Moynieux Automatic Envelope Enclosing Machine. This machine is arranged to pick up circulars, fold them, address them, stamp them, seal them and count them. One cannot but be impressed when looking at the machine in operation as to how many hours of worry and study were required to accomplish this most wonderful feat. The machine resembles a large steel table, on one end of which are arranged six compartments, which are for six piles of different circular manner. Six hands working mechanically pick up a circular from each and lay them in six piles on the movable table just back of the main table. When the six hands pick an other set of six different circulars, the side section of the table moves over one, the six hands come back and lay down on top of the previous six piles an additional circular, making six piles, and so on until the first pile moved along one and the second pile is the insertion of the circulars into the envelope; the next move that the machine makes is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device. If it is required that the flap be inserted on one side and the other hand protrudes and pushes down the flap inside the envelope; if it is desired to seal the envelope, this attachment is removed from the machine before it is started, and the second device is brought into action, which includes a movable sponge for pressing an adhesive paper containing six different circulars, and each of the other piles contains five, four, three, two and one circular. In this automatic way the six sets of circulars are assorted out by the so-called fingers and are placed on the movable table in proper form and position to be put in an envelope. Another local move takes the flap of the envelope and inserts it into the envelope; the next move is the conveying of the envelope around the side of a cylinder, where two separate attachments are connected, one for inserting the flap and the other a sealing device.
